What is building automation?

Source: <http://baas-itea2.org/>

What is building automation?

Building automation

- Distributed control system for networking devices
- Monitoring and control of appliances

Home automation

- Extension for residential building automation
 - Comfort
 - Housework
 - Multimedia
 - Pet feeding
 - Energy efficiency

SMART HOME

Source:us.123rf.com

Problem: separated sub domains

Fire, flood and
life safety

Heating,
ventilation,
airconditioning

Building
management
systems

Security and
access

Lighting

- Different semantics, protocols, data and security models
- Fields for data usage/analysis are kept small
- High engineering effort to make sub domains interoperable

Source: http://www.swiss-architects.com/projects/projects_detail/2433

Problem: proprietary engineering

- Reinvent the wheel
- Bunch of different tools and technologies
- Cause interoperability issues

Source:
Flow-meter: <http://ahnam.net>
Valve: <http://www.uniklinger.com>

Problem: no explicit semantic model

- Ambiguities in the meaning e.g.:
 - What is the temperature of a freezer, heater?
 - What to expect when subscribing to an event?
- Prevents dynamic service (re-)configuration
 - Which function should be used? Run() or Start()?
- Some aspects might be omitted that are valuable to other services
- Experts needed for development
- Additional time to examine which data is needed and what the data reflects

Domain specific
language (DSL)

- Abstract from communication mechanisms:
 - Technologies
 - Protocols
- Generated code is using standard IT infrastructure
- Faster development

Semantic and syntactic
description of entities

- Comprehensive data models
- Domain knowledge

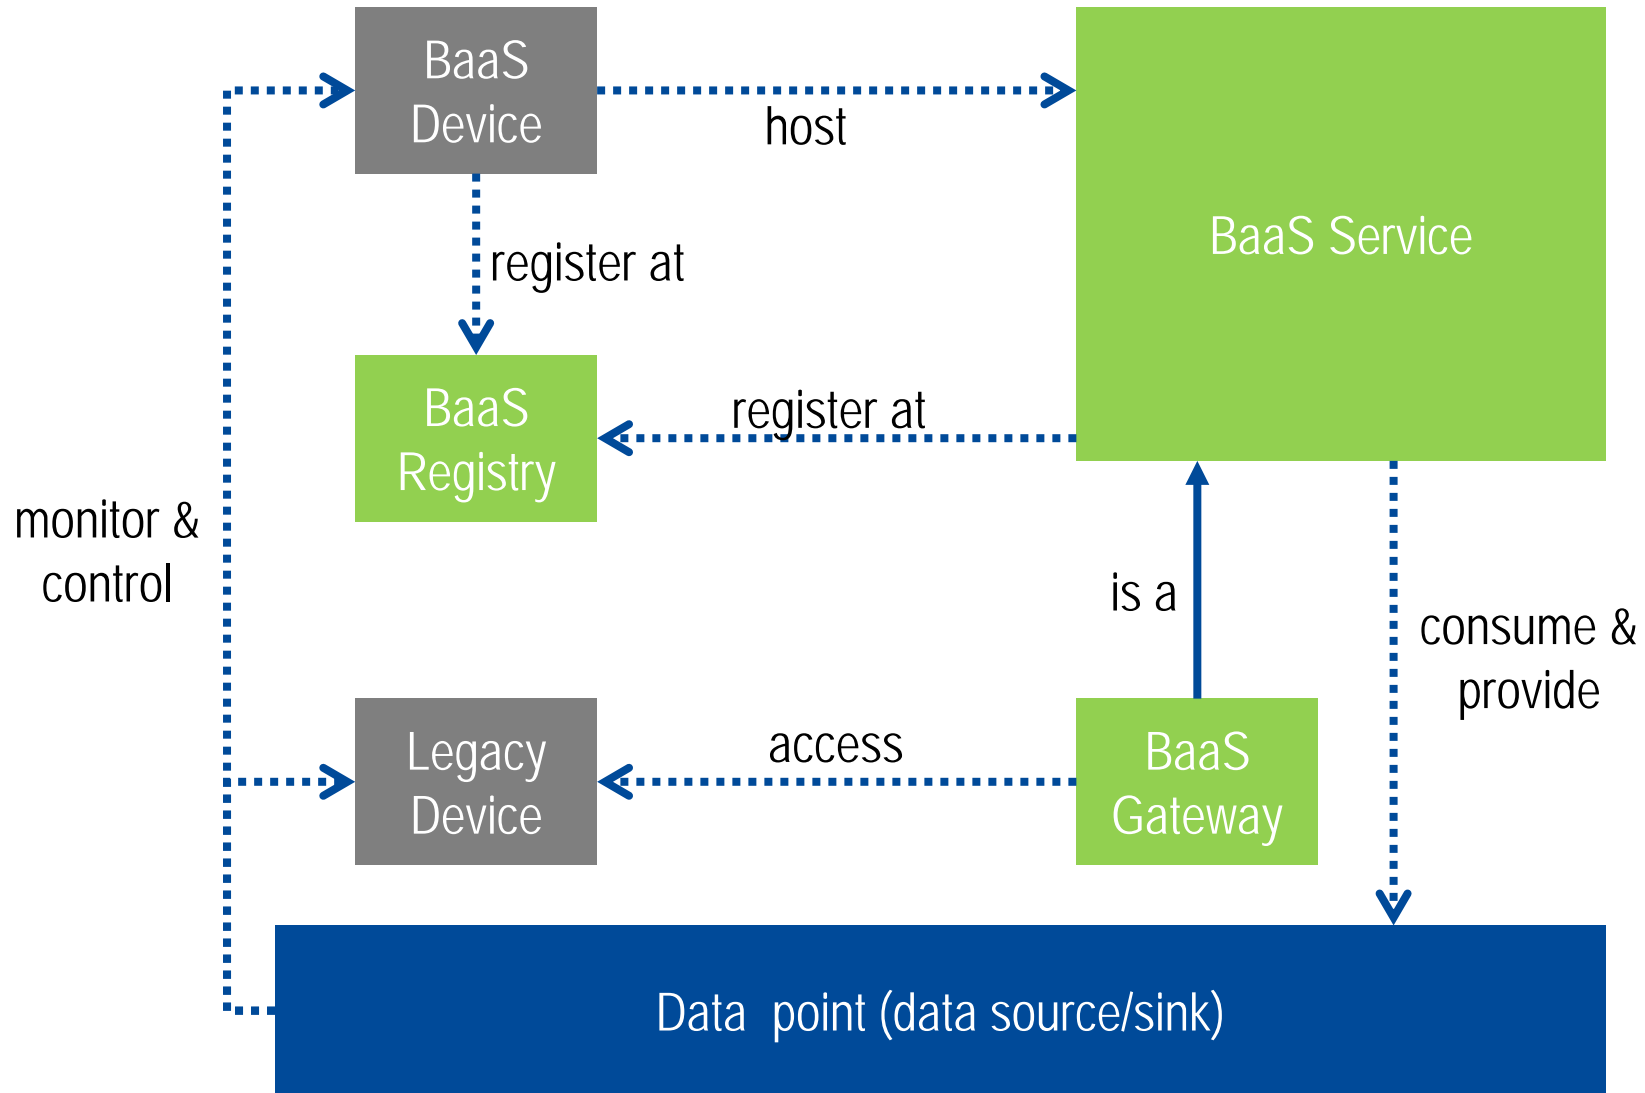

Development tool

A short DSL example

```
device Weatherstation {  
    namespace https://example.org/weatherstation  
  
    service temeratureSensor {  
        attribute temperature read event;  
        attribute unit read;  
        attribute alertTemperature read write;  
    }  
  
    service humiditySensor {  
        attribute humidity read event;  
    }  
}
```

The BaaS domain model

- Contains data point descriptions
 - Describing all data points within the building automation domain
 - Relates different data points with each other
- Can be queried for specific data points
- Provided by the BaaS project
- Extended by a domain expert

- Abstract definition:
 - Required data points of a service
 - Provided data points of a service
- Select additional adapters:
 - Communication protocols
 - Security
 - Administration
 - ...

- BaaS SDK generates:
 - Service basic code
 - Code for:
 - Communication protocols
 - Interface
 - Security
 - Administration
 - Used libraries
- The software engineer just needs to provide the business logic
 - Use tool of own choice

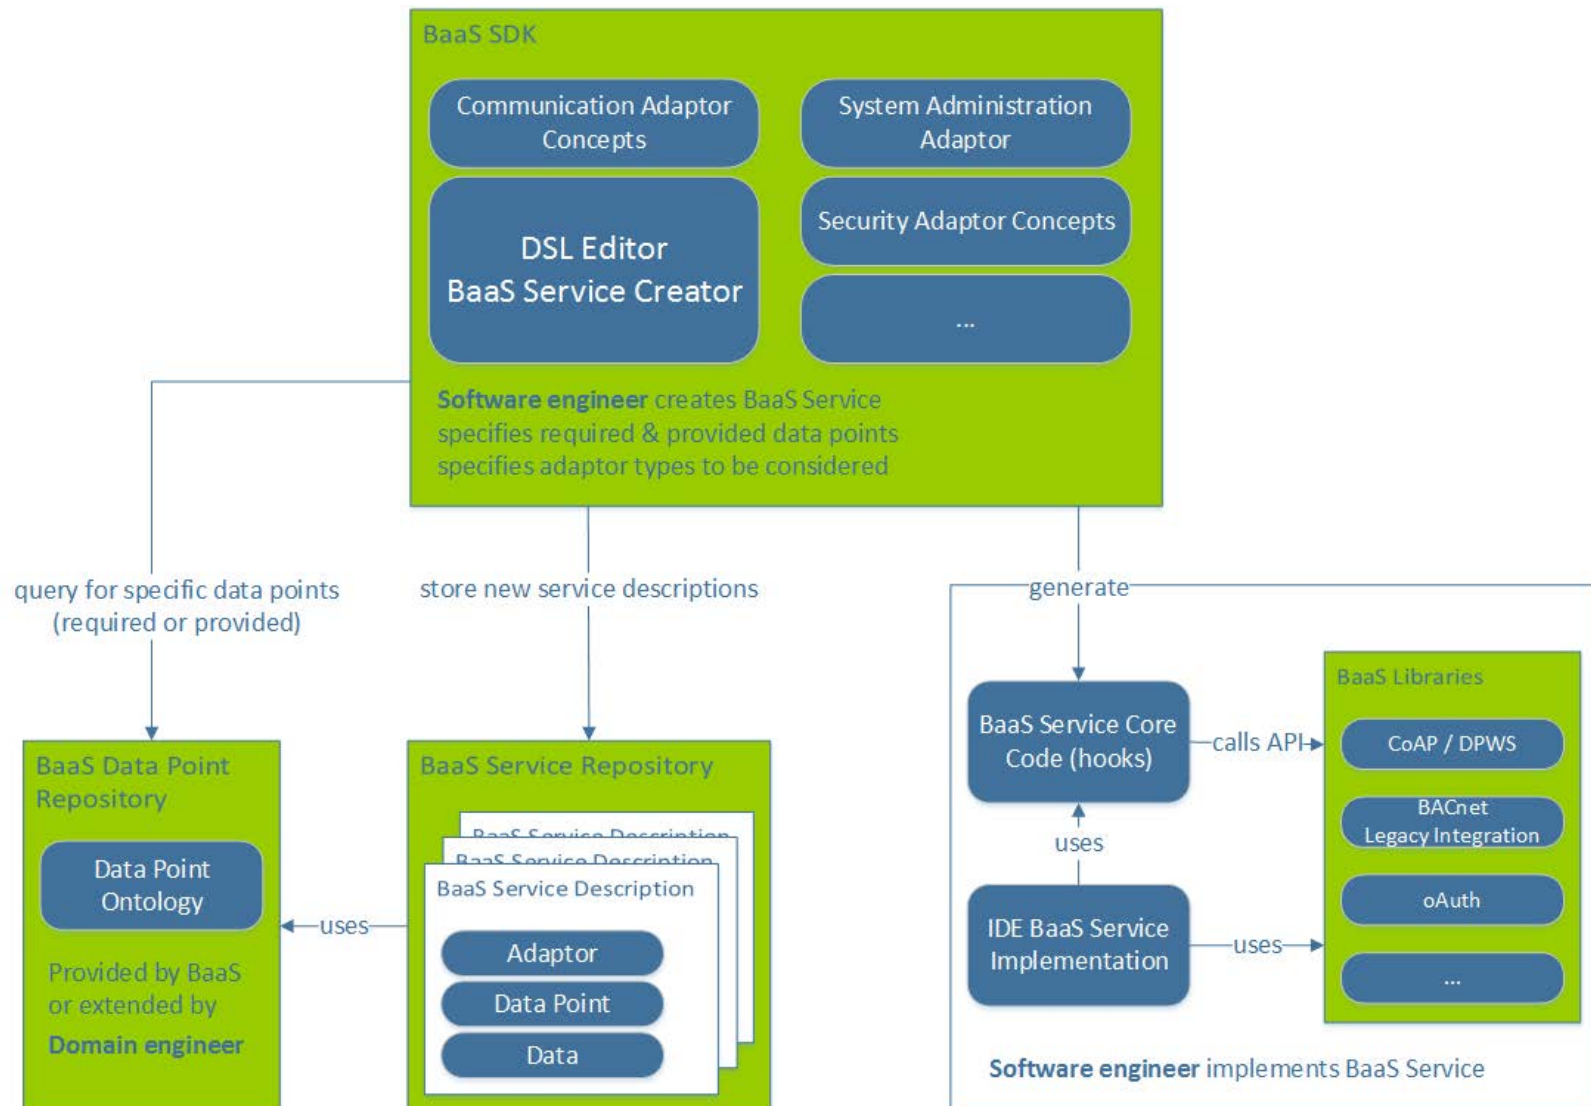

- Store information about each engineered service
 - Provided data points
 - Required data points
 - Used adapters
- This information can be used later when planning installations
 - Plan multiple instances
 - Check if conditions for service operation are given
 - Required data points
 - Used adapters
 - Check if information is consumed (provided data points)

- Combining a domain specific language and semantic descriptions
 - To create building automation services ...
 - ... abstracted from communication mechanisms
 - ... with comprehensive data models
 - ... with less domain knowledge
 - ... using standard IT infrastructures
 - ... in a shorter time
 - Enable the use of information in further steps
- Future Work
 - Methodology and (graphical) tool for engineering building automation installations based on developed services and existing infrastructure
 - Tool for commissioning services in the field

- A domain specific language is ...
 - ... a formal language having syntax and semantic
 - ... limited to a certain domain
 - ... used to easily describe entities, relations, problems and solutions
- A domain specific language can be ...
 - ... a graphical or textual language
 - ... an extension of an existing language or a stand-alone language
